

ABSTRACT OF THE DISCLOSURE

An electrophotographic apparatus comprises a plurality of image forming devices overlapped one another. The image forming device comprises a developing device comprising a tip end part and a toner storage part coupled to the tip end part. A thickness of the tip end part in an overlapped direction is smaller than a thickness of the toner storage part. An exposure device is arranged in a location, in which the tip end part is small in thickness. A toner regulatory blade extends in a direction along a normal to the overlapped direction and arranged so as to come into contact with a developing roller from a direction following rotation of the developing roller.
